

Golden_C_DB

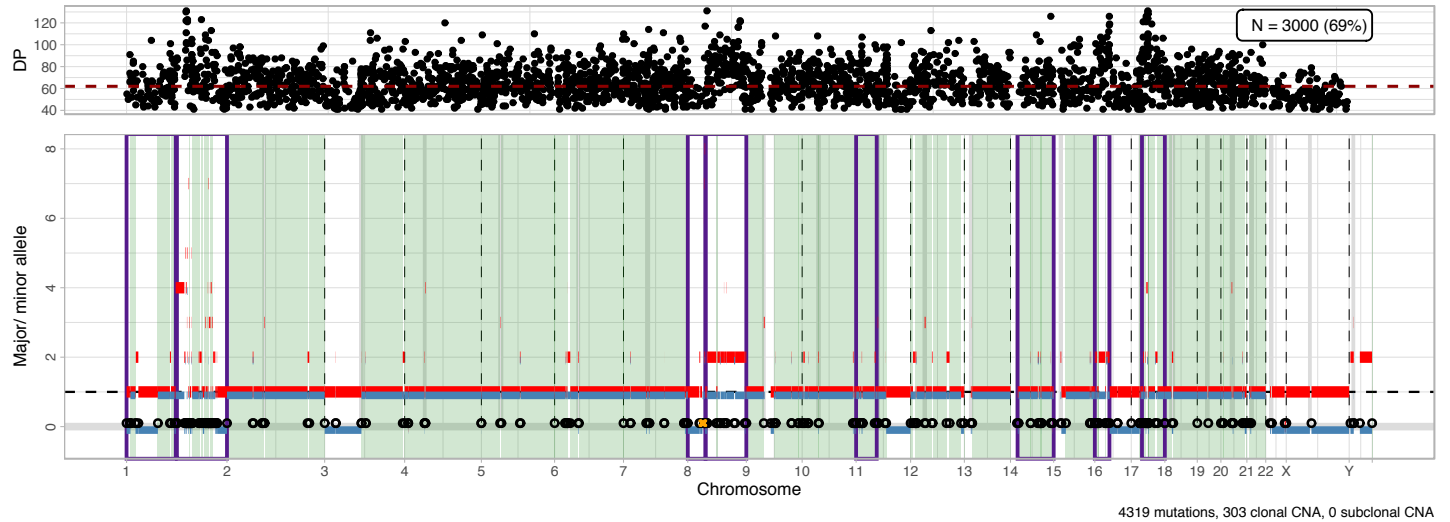

Data quality check (QC) from matched Copy Number and mutation data.

PASS rate 66.666666666667

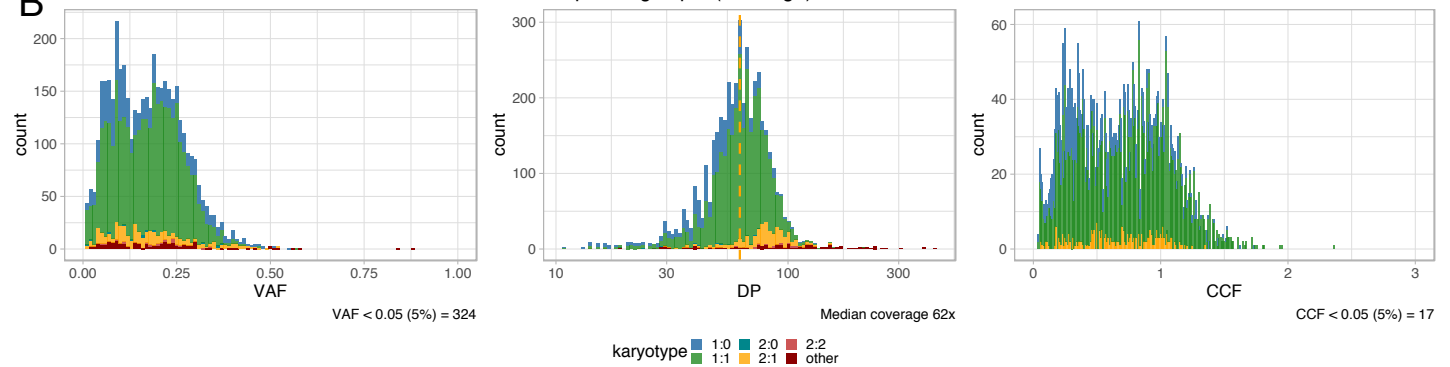

Golden_C_DB

CNA Segments (A), mutations (B), genome coverage (C) and QC (D).

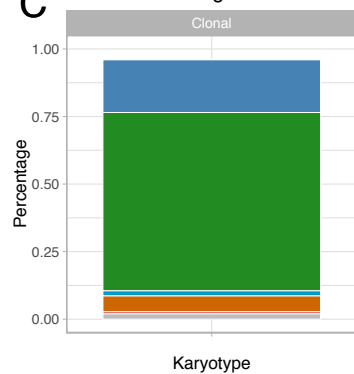

A Ploidy 2, most prevalent karyotype is 1:1 (Major:minor).

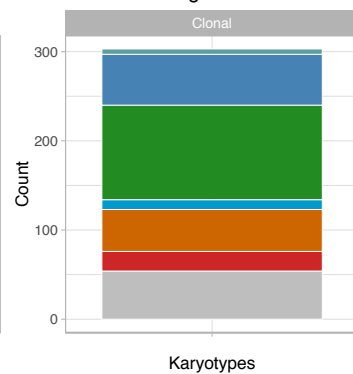

B Raw VAF

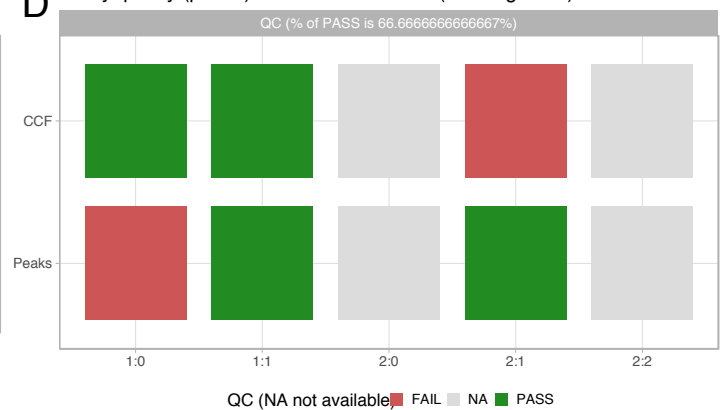

C Genome coverage

Number of segments

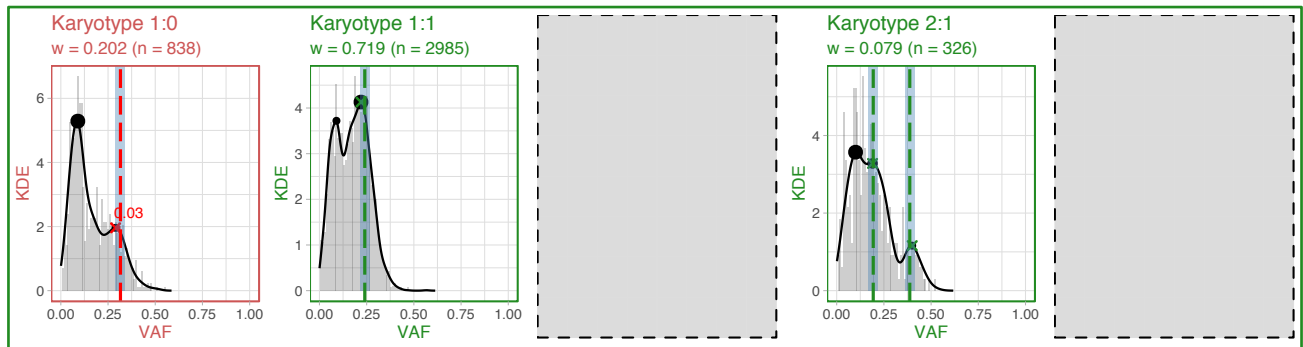

D Purity/ ploidy (peaks) and CCF estimates (% assignable)

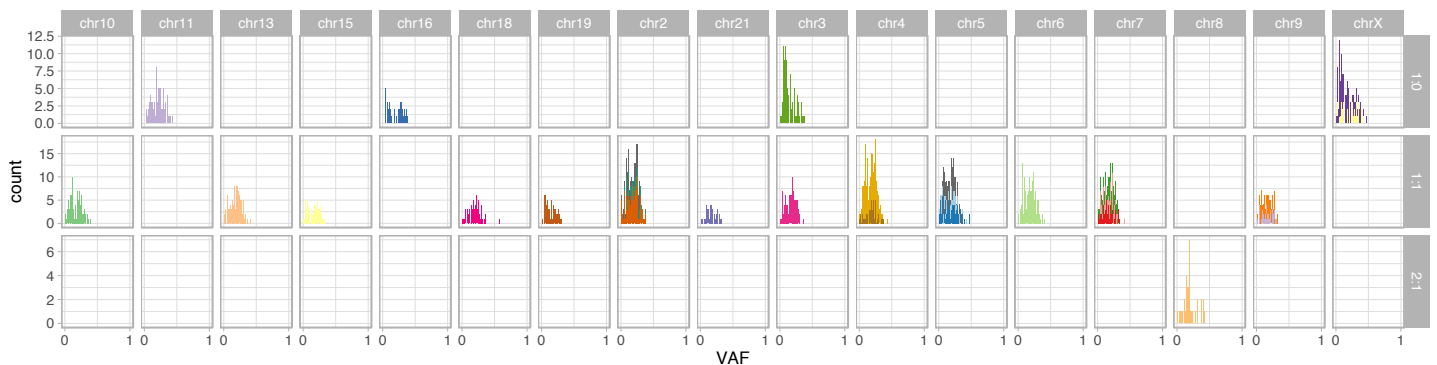

Golden_C_DB

Purity/ ploidy QC (A), data (B) and fragmentation (C).

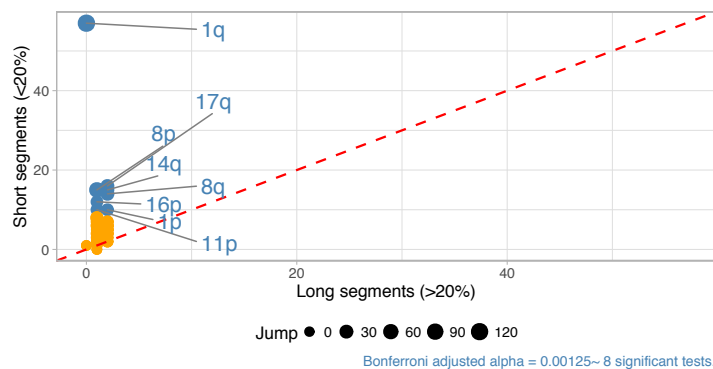

A Purity and ploidy QC via peak detection (purity $p = 48\%$)

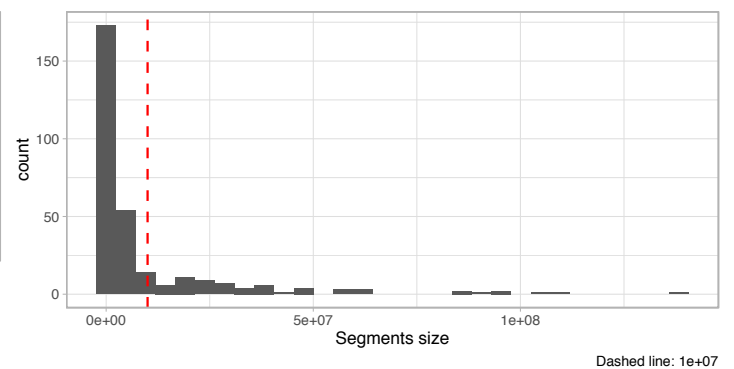

B Segments with >43.19 mutations (1% of total) and >167394.9 bases (10% of median length)

C Arm-level segments fragmentation (% relative to arm length)

Segments size distribution

Golden_C_DB

Cancer Cell Fractions estimation and QC.

QC PASS (per karyotype) if we can assign >90% of mutation burden
